Changed fitting for the heating resistor of IWT 1466.0W - spare-part no. 439423

On the basis of an improved production method for the heating element, the fitting of this element has now been changed. The new heating elements are compatible with the heating elements in the older models, but the wiring will need to be changed as follows.

Procedure:

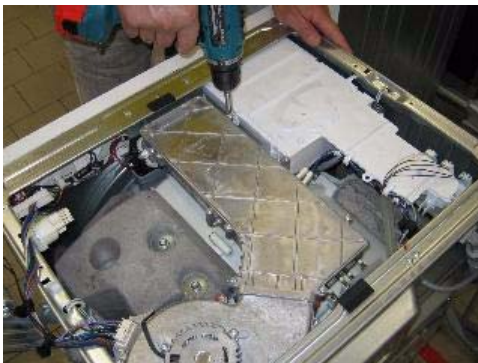

1. Remove the screws from the cover plate.

2. Remove the screws from the top cross bar.

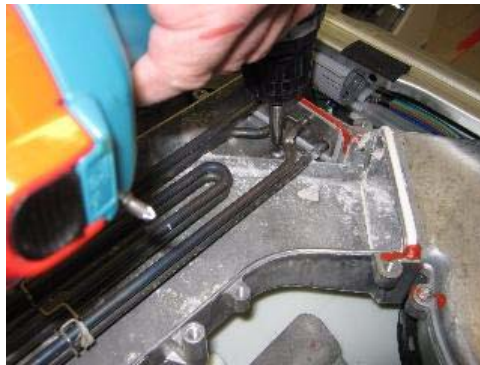

3. Remove the screws from the dryer cover.

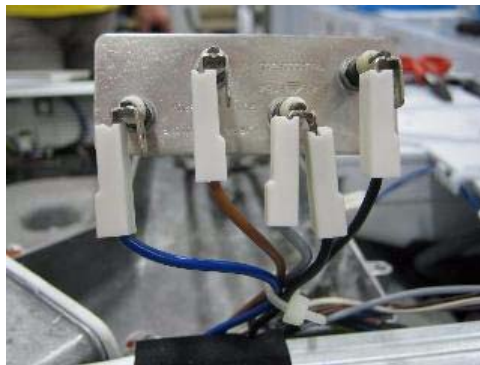

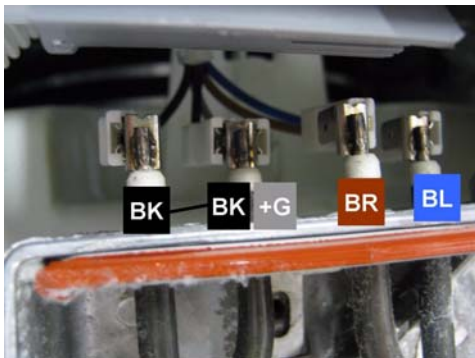

Pay attention to the sealing!

4. Remove the two fastening screws from the heating element.

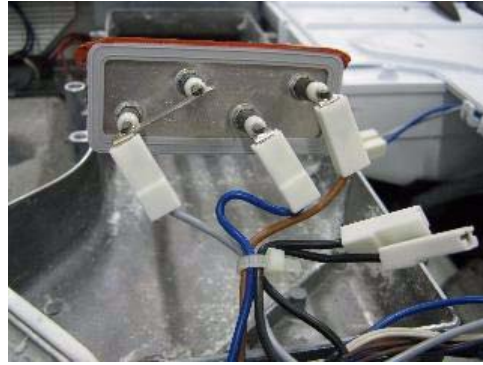

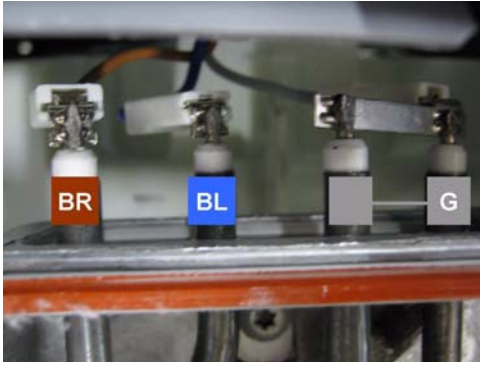

Attention: Wiring colours for the old configuration.

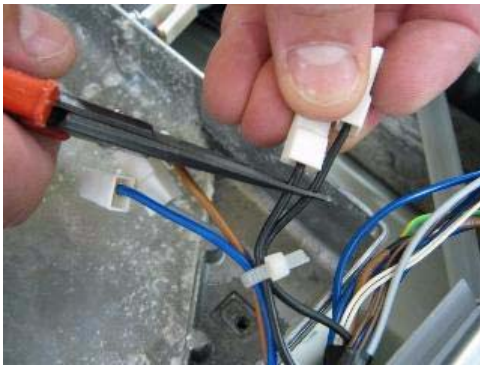

5. Replace the heating element with the new heating element.

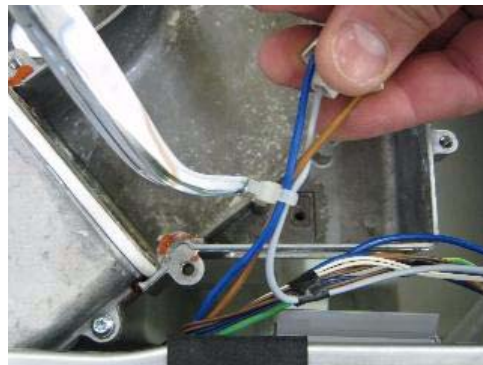

Attention: Wiring colours for the new configuration.

Remove the black "jumper". To do so, first of all cut off the fasten connector.

Then remove the cable and tighten the cable clamp.

CAUTION! It is essential to seal the edge of the heating element with a suitable adhesive before installing the element. Replace the cable in the slot.
